

# Home assignment for front-end developers

You have a list of cities in JavaScript:

```
[{name: "Moscow", count: 12, content: "<p>description</p>"}, {name: "Amsterdam", count: 25, content: "html"}, {name: "Lisbon", count: 15, content: "html"}, {name: "Berlin", count: 19, content: "html"}, {name: "Madrid", count: 25, content: "html"}]
```

Sort the list alphabetically, divide it into three columns and display it on the page like so:

## Popular destinations

[Amsterdam](#) (25)

[Lisbon](#) (15)

[Moscow](#) (12)

[Berlin](#) (19)

[Madrid](#) (25)

[Additional content is displayed here.]

Clicking on each city name displays some additional information about the city (some html) below the list.

The number of cities in the list can be variable.

You can use any JS library you want. Please implement a cross-browser solution.
